The Sites

The places of intervention

When walking along the Aurelian wall, it performs differently according to its context. As a consequence of the topography, the urban landscape and the wear and tear of historical events, the wall presents itself in a variety of ways.

The intervention can take place in spaces where the wall is intact and has a thickness of 3,5 meters

Examples of possible sites of reuse

with openings, which enables inhabitable spaces within the wall.

As the physicality and context of the wall changes, it provides different qualities generating a variety of interventions. This project goes into detail in one of the many possible sites, located near the gate of Saint Giovanni.

LIVING ON THE LUNGOTEVERE

The project is rooted in reviving the River Tiber with life and activity. The co-living development creates a mixture of public and domestic spaces where people can work together, co-habitate and reconnect Rome with the River Tiber. The buildings create a physical connection between the city of Rome and the River Tiber with indoor and outdoor spaces for both the public and the residents. Today, the Lungotevere are not used to their full potential as many people feel unsafe

and unsheltered while being removed from the life and activity of the city centre. This project defines the space with activities and breaks down the volume of the Lungotevere with terraces, piazzas and indoor spaces. It maintains places for the current users, walkers, cyclists, painters and fishermen, however, it also introduces a community who will cherish the space and bring new life to the Lungotevere.
